

RIDE. Design System

Foundation, visual language & reusable components

DESIGN OVERVIEW

This page defines the visual foundation of RIDE. The system establishes a consistent color palette, typography hierarchy, spacing scale, border-radius tokens, layout grid and elevation rules. It also demonstrates the core reusable UI components used throughout the ride-booking experience.

KEY POINTS

- Color tokens create a clear visual hierarchy with black as the primary action color and lime as the brand accent.
- Typography uses Poppins with defined sizes and weights for headings, body copy, captions and buttons.
- The 390 × 844 mobile base uses a 4-column grid with 20 px margins and 12 px gutters.
- Reusable components include buttons, search/input, ride cards, status indicators, map controls and navigation.

RIDE. Key Screens

End-to-end ride booking flow

DESIGN OVERVIEW

These screens demonstrate the primary user journey from opening the app to completing a ride. The flow keeps the hierarchy simple: choose a destination, compare ride options, track the assigned driver and review the final fare and payment details.

KEY POINTS

- Home / Map provides the starting point and current location context.
- Destination Search supports quick destination entry and recent-place selection.
- Ride Selection compares Economy, Premium and XL options with estimated fares.
- Driver Tracking surfaces ETA, driver information and essential actions such as Call and Cancel.
- Ride Summary / Payment closes the journey with fare breakdown, payment method and receipt access.

RIDE. States & Responsive

Interaction states, lifecycle & mobile adaptation

DESIGN OVERVIEW

This page documents how the interface behaves beyond the default state. It covers component interaction states, the ride lifecycle and responsive behavior across three mobile widths, while also recording key accessibility considerations.

KEY POINTS

- Button states cover Default, Hover, Active, Selected, Disabled and Loading.
- The ride lifecycle is represented from Searching through Driver Assigned, Ride in Progress, Completed and Cancelled.
- Responsive layouts demonstrate adaptation at 320 × 693, 390 × 844 and 430 × 932.
- Accessibility notes prioritize 44–48 px touch targets, high-contrast text and status communication using both color and text.

RIDE — STATES & RESPONSIVE

Interaction states, ride lifecycle and mobile adaptation

COMPONENT STATES

Default

Hover

Active

Selected

Disabled

Loading

RIDE LIFECYCLE

Searching
Finding a driver

Driver Assigned
Driver found, on route

Ride in Progress
Trip in progress

Completed
Trip finished, receipt ready

Cancelled
Ride cancelled

RESPONSIVE BEHAVIOR

Same hierarchy, tighter gutters, adaptive card widths.

320 × 693

Where are you going?

Confirm Ride

390 × 844

Where are you going?

Confirm Ride

430 × 932

Where are you going?

Confirm Ride

ACCESSIBILITY NOTES

- 44–48 px touch targets for primary controls
- High-contrast black text on light surfaces
- Status uses color + text, not color alone
- Layout adapts from 320 px to 430 px widths
